

Electronic DC Loads

SINGLE CELL LOAD SCL SERIES

- Loading down to min 0.6 V or even to 0 V (SCL ZV) at maximum current
- Basic operating modes CC, CV, CR, CP
- Combined operating modes CC+CV, CR+CC+CV, CP+CC+CV, CV+CC
- Adjustable protections for current and undervoltage
- Square, PWM and modulation function
- List function with synchronized DAQ
- MPP tracking
- Test of energy storage devices
- Internal resistance measurement function
- Master-slave operation for parallel connection
- Data storage directly to USB flash drive
- Electronic protection
- I/O port as standard
- Galvanically isolated I/O port optional
- Bilingual help system (German/English)

SCL Series – Brief Profile

With load currents of up to 1,200 A, these electronic loads are predestined for testing fuel cells or other high-current power sources.

Two variants are available: The standard SCL operates with maximum current from an input voltage of 600 mV, the SCL ZV even from 0 V.

Functions for testing energy storage devices are integrated as standard.

Various models with different power classes are available in the compact 19" housing with only 2 height units. Several units can be connected in parallel to increase performance. The modern operation via a brilliant 4.3" touch display gives the user a comfortable smartphone feeling.

All common data interfaces are standard, only GPIB is optional.

Interfaces

- RS-232
- USB
- LAN
- GPIB
- CAN
- Analog
- Analog isolated

● Standard ○ Option — not available

Operating Modes

The devices have the basic operating modes constant current, constant voltage, constant resistance and constant power (CC, CV, CR, CP mode). Additionally, a protection value for undervoltage and overcurrent can be set. This allows the combined operating modes CC+CV, CR+CC+CV, CP+CC+CV, CV+CC to be realized.

Protection, Monitoring

- Overcurrent protection
 - Undervoltage protection
 - Power protection
 - Overtemperature protection
 - Overvoltage indication
 - Reverse polarity indication
- Adjustable overcurrent and undervoltage protection are permanently active.
- Undervoltage protection works either with:
 - regulating transition (e.g. CC-CV operation at battery discharge)
 - switching transition (short dead time, e.g. when switching the input voltage)

Loading Capacity, Cooling

With different voltage classes, the loads of the SCL series allow the connected DUT to be loaded at full current down to a minimum voltage of 0.6 V, the SCL ZV variants even down to 0 V. The devices are air-cooled with a stepless fan control.

I/O Port

Analog signals
in realtime!

Standard I/O port for:

Outputs:

- Analog voltage monitor output 0 ... 10 V
- Analog current monitor output 0 ... 10 V
- Load input activation state
- Status overload
- Programmable logic output
- Trigger output

Inputs:

- Analog load setting I and V with 0 ... 5 V and with 0 ... 10 V
- Analog protection setting I and V with 0 ... 10 V
- Load activation
- Operating mode selection CC - CV
- Control speed selection
- Remote shut-down
- Readable digital input
- Trigger input

Galvanically Isolated I/O Port (Option SCL06)

Option SCL06 can be installed for galvanic isolation of the analog I/O port from the load circuit. By using this card ground loops are prevented and it is possible to test bipolar voltages with common analog control using two devices.

Factory Calibration Certificate (FCC-SCLxx)

2 x for free

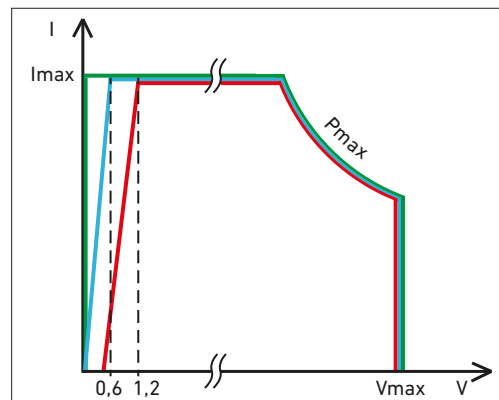

We supply a free Factory Calibration Certificate (FCC) with the devices. The calibration process is subject to supervision in accordance with DIN EN ISO 9001. This calibration certificate documents the traceability to national standards to illustrate the physical device in accordance with the International System of Units (SI). Within the 2-year warranty period, we will calibrate a second time free of charge if the respective device will have been registered:

<https://www.hoecherl-hackl.com/service/device-registration>

For use under laboratory conditions, H&H recommends a calibration interval of 2 years. This is an empirical value that can be used as a guide for the first period of use. Depending on the intended use, service life, relevance of the application and ambient conditions, the operator should adjust this interval accordingly.

Operating Range

Minimum Voltage

Operating range of different DC loads

Unlike standard loads, the minimum voltage for full load current for the SCL series is in the millivolt range, and even 0 V for the SCL ZV variants.

— Standard electronic load
— SCL
— SCL ZV

Mechanics and Options

Mechanics

The SCL series is designed in stable 19" technology and can be used as a desktop unit or installed in 19" racks without any additional installation kits.

Load Terminals

In all models of the SCL series, the load connections are implemented as solid flat copper bars. Per bar, up to 2 cable lugs can be contacted on both sides with M12 screws and a maximum of 150 mm² each.

Parallel Connectors

Option SCL08 for 2 devices
Option SCL09 for 3 devices
Option SCL10 for 4 devices
Option SCL11 for 5 devices

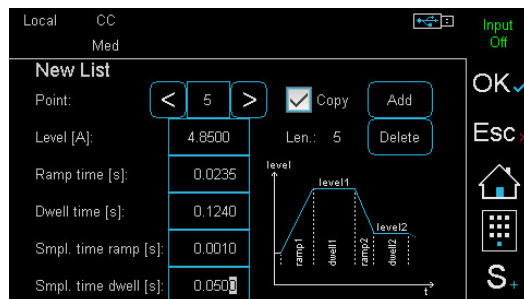

Parallel connectors

For easy parallel connection, depending on the number of devices, appropriate busbars are screwed to the load inputs.

Functions

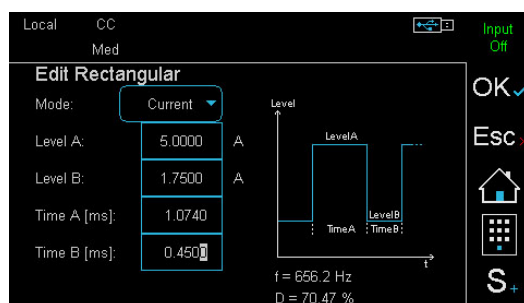

Load Profiles (List Function)

In all operating modes CC, CV, CR, CP the electronic loads can produce load profiles by List function. Up to 300 settings with variable dwell and ramp times are possible.

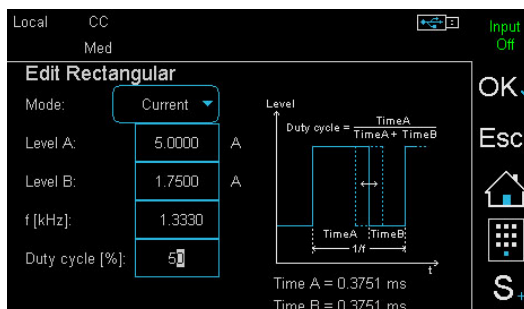

Voltage and current are measured synchronously and stored with a time stamp. Associated sampling times can be defined for each curve section.

Rectangular Function

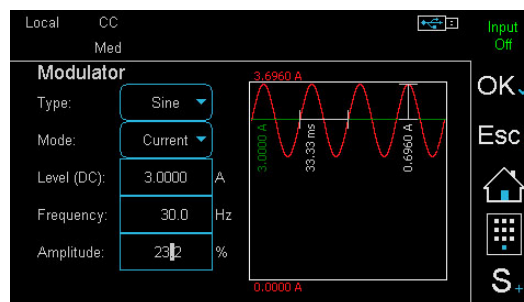

The rectangular function provides a convenient way to generate a rectangular waveform by entering absolute time and amplitude values.

PWM Function

With the PWM function, the switching frequency and the duty cycle can be set for the two amplitude values in manual operation.

Modulator

The modulator adds a sinusoidal, square-wave or triangular signal to a static setting in CC or CV mode. Frequency and modulation depth are adjustable.

MPP Tracking

V/I and V/P characteristic at the user interface

The Maximum Power Point Tracking (MPPT) function consists of the two sub-functions Sweeping and Tracking, which alternate continuously in an adjustable interval.

If the measured open circuit voltage at startup is higher than the minimum voltage, the electronic load performs a sweep and then adjusts the global MPP found. The swept V/I curve is displayed together with the V/P curve in the function graph of the user interface. The currently determined MPP is marked by a '+' in the diagram. The V/I characteristic can be read via a data interface.

Discharge Function, Energy Storage Test

IUa discharge with follow-up time

The discharge function tests energy storage devices such as batteries, ultracaps and electrolytic capacitors etc. by discharging them in CC, CP or CR mode. The discharge function can be combined with the list function so that pulsed discharge is possible.

IUa discharge (CC+CV discharge) is also possible: the test object is discharged with constant current up to a defined voltage.

This voltage is then kept constant until a defined minimum current is reached.

Stop criteria are charge, energy, time, current, voltage.

During data logging, a follow-up time can be defined to observe the regeneration phase.

Internal Resistance Measurement

Ri calculation timing

The electronic load can measure the internal DC resistance of the connected DUT. The determination of the internal resistance R_i is based on the principle specified in various standards for batteries and accumulators, e.g. DIN EN 61951, DIN EN 61960.

At intervals of a few seconds, the load measures the terminal voltage of the DUT (V_1 , V_2) at two defined load levels (I_1 , I_2) and calculates R_i from this.

The load levels I_1 and I_2 as well as their durations are adjustable.

In manual mode, the load can store the parameters and the result of the measurement on a connected USB mass storage device at the touch of a button, so that a high throughput with many DUTs may be achieved.

Data Logging (DAQ)

The electronic load is able to synchronously store data records of voltage and current with time stamp internally in a defined interval. Up to 40,000 data records are stored in a ring buffer and can be read via a data interface. After recording is finished, the data can also be transferred to a USB flash drive.

For processes with storage intervals in the seconds range, the data can also be stored directly on the USB flash drive.

Trigger Model

Several functions or settings can be triggered by a configurable trigger model:

- Activate/deactivate load input
- Start/stop LIST function
- Start/stop data acquisition
- Set triggered settings of all operating modes

Available trigger sources:

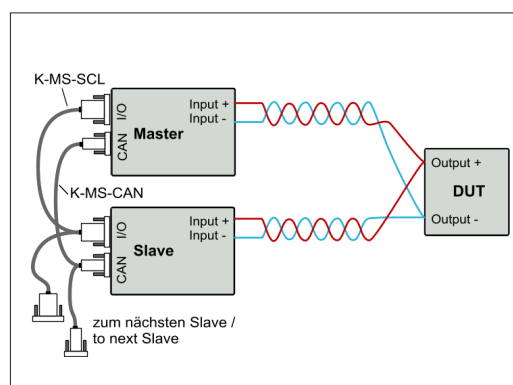

- Extern
- Bus
- Manual
- Voltage
- Current

Changing Regulation Speed

Sometimes special DUTs or very long load cables require modification of the electronic load's regulation time constant to avoid oscillations and establish stable operation.

Regulation speed slow - medium - fast are selectable. See model overview.

Master-Slave Operation

Master-slave operation in system connection

To increase the power or current, up to 5 equal loads¹⁾ can be connected in parallel in master-slave operation²⁾.

The system operates externally as if it were one single device. The master unit controls the total current of the system, displays the total measured values and supplies these when queried via one of the data interfaces.

Wiring:

One set each of K-MS-TRL and K-MS-CAN master-slave cables on all slave units (available from H&H or can be assembled by the user).

To be able to access monitor signals etc. when using the master-slave cable K-MS-TRL, we offer a SubD25 doubler as an accessory.

Watchdog Function

In digital remote operation, the electronic load has got a watchdog function switching the load input off if the previously programmed watchdog delay expires without resetting the watchdog.

The watchdog delay is set by SCPI command. Another command activates the watchdog. Then the control program must ensure that the command to reset the watchdog is sent periodically to the electronic load before the delay time expires.

Save Settings

In order to be able to quickly reconstruct recurring test tasks, the settings active in the electronic load can be stored in non-volatile memory (internal or external to USB flash drive) so that they can be reloaded at a later time. 9 internal memory positions are available.

The load can alternatively set reset values at power-up, the last active settings at power-down or memory position 1 to 9.

1. Equal models and equal firmware versions

2. In master-slave mode reduced function scope, controlling via CAN interface not possible
